## ALIGNMENTS

Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomicleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 k range using preparative agarese gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AP129072.1) a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance." was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil | 4732114 | gb | AF129972.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at http://dbsgap.versailles.inra.fr/publiclines/. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (http://www.genoplante.com and http://genoplante-info.infobiogen.fr).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Arabidopsis thaliana (thale cress)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AAH90177 standard; cDNA; 51 BP.

```
The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified by selecting a bait protein from a known adipocyte marker and then performing a yeast 2-hybrid selection to isolate prey proteins encoded by members of an adipocyte cDNA library. The proteins are designated SID (RTM) (selected interacting demains) proteins. Also included are a polymucleotide encoding a polypeptide in the adipocyte cells, a recombinant host cell expressing at least one of the interacting colls, a SID (RTM) polypeptide comprising any of the 738 amino acid sequences given in the specification (including its fragment or variant), a such (RTM) polymucleotide comprising any of the 738 mucleotide sequences given in the specification (including its fragment or variant), a vector comprising the SID (RTM) polymucleotide, a recombinant host cell comprising the vector, a protein chip comprising the polypeptides and a recombinant host cell comprising all or part of the data, listed in the specification. The complex, polypeptides, polymorleotides and compounds are useful for the order subsetty of the data, higher are useful for the polymorleotide are useful as the polymorleotides are useful to the maniant of the data and compounds are useful to the maniant mate or diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    complex between two interacting proteins in adipocyte cells, useful identifying selected interacting domains that modulate protein gractions, or for preventing or treating metabolic disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The polymucleotides are useful as probes or primers. The complex is particularly useful for identifying selected interacting domains (SID (RTM)) for screening drugs that modulate the protein interaction, thus exhibiting the therapeutic effect. The present sequence encodes a bait
                                                                                                                                                                              Human, 88; gene, bait, adipocyte, SID; selected interacting domain,

```
Sequences AAH90121-AAH90700 represent 580 human cDNA sequences which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 568 (AAH90121-AAH90688) are consecutive pairs of nucleotides which contain silent SNPs. Sequences 569 to 580 (AAH90689-AAH90700) are consecutive pairs of nucleotides containing SNPs which result in changes in the corresponding amino acid sequences (AAG64751-AAG64752). The SNPs in sequences 569 to 574 (AAH90689-AAH90609) result in changes, while those in sequences 575 to 578 (AAH90698) result in non-conservative changes. The SNP in sequences 579 and 580 (AAH90699) result in non-conservative changes. The SNP in sequences 579 and 580 (AAH90699) result in non-conservative changes of two nucleic acids in a nucleic acid and a method of detecting a polymorphic site in a nucleic acid and a method of detecting polymorphic proteins/ peptides using the antibodies. The nucleic acids are useful for gene therapy of an individual having, suspected of having, or at risk of developing a pathological condition due to the presence of a sequence polymorphism. Such treatment would comprise administration of the wild-type nucleic acid sequence polymorphise administration of the wild-type nucleic acid sequence polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotides containing single nucleotide polymorphisms, for detecting the presence of polymorphism, detecting a polymorphic site, and treating a patient suffering from a pathology ascribed to the

Sequences AAH90121-AAH90700 represent 580 human cDNA sequences which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 568 (AAH90121-AAH90688) are consecutive pairs of nucleotides which contain single nucleotides solved to silent SNPs. Sequences 569 to 580 (AAH90689-AAH90700) are consecutive pairs of nucleotides containing SNPs which result in changes in the corresponding amino acid sequences (AAG64751-AAG64762). The SNPs in corresponding amino acid sequences (AAG64751-AAG64762). The SNPs in an in non-conservative changes. The SNP in sequences 559 to 574 (AAH90689-AH90699) result changes, while those in sequences 575 to 578 (AAH90699) result changes, while those in sequences 575 to 578 (AAH90699) result conservative changes. The SNP in sequences 579 and 580 (AAH90699) containing the relatedines of two nucleic acids. It also encompasses of determining the relatedines of two nucleic acids. It also encompasses containing polymorphic sites, antibodies raised against such chantibodies. The nucleic acids are useful for gene therapy of an individual having, suspected of having, or at risk of developing a individual comprise administration of the wild-type nucleic acids acids are useful for gene therapy of an individual would comprise administration of the wild-type nucleic acids acids equence polymorphism. Such treatment would comprise administration of the wild-type nucleic acids acids equence. Antibodies raised against polymorphic peptides can also be used in the treatment of such individuals

RESULT 4 ADR27689/c

셤 ઠે

The present invention relates to a leptin receptor related protein (OBCRGRP) antisense oligonucleotide (ON; ADR27653), that hybridises

CRGRP) antisense oligonucleotide (ON; ADR27653), that hybridises

CRGRP) antisense of leptin receptors on the cell surface and may

CRG specifically with and inhibits the expression of ADR27652. The ON

CRG contain phosphorothioate bonds; 2'-O-methyl nucleotides and/or a

CRG triethyleneglycol residue at the 3'-end. Also claimed are interfering RNA

CRG (IRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit

CRG (IRNA) of 16-25 nt that hybridize specifically with ADR27672, and inhibit

CRG coding sequences comprising OB-RGRP or WY047 (thought to be a member of

CRG (IRNA) for detecting compounds that OB-RGRP), and a protein that

CRG (IRNA) for detecting compounds that Modify the interaction between

CRG (IRNA) for detecting compounds that modify the interaction between

CRG (IRNA) for detecting compounds that modify the interaction between

CRG (IRNA) for detecting compounds that modify the interaction between

CRG (IRNA) for detecting compounds that modify the interaction between

CRG (IRNA) for detecting compounds that modify the interaction between

The method comprises measuring the effect of a test compound on the expression of at least one of the genes LEPROTL1 (leptin receptor overlapping transcript-like 1) or OB-RGRP (leptin receptor gene related protein). Alternatively the method comprises measuring the effect of the compound on intracellular transport as far as the cell membrane (CM), the presence at CM, and internalisation from the membrane of proteins (X) encoded by the specified genes, or parts of them. Compounds of the invention are used to treat or prevent obesity, weight loss and diabetes.
                calcification; obesity; diabetes; anorexia; disorders of sexual maturity, hematopolosess, anglogenesis, thrombus formation, regulation of immunity and inflammation, fetal development and cancer. The present OB-RGRP antisense oligonucleotide was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antidiabetic; anorectic; weight loss; weight gain; diabetes; LEPROTL1; leptin receptor overlapping transcript-like 1; OB-RGRP; leptin receptor gene related protein; intracellular transport; obesity;
                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            current sequence represents a primer for the amplification of OB-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying compounds useful for treating loss or gain of weight or diabetes, from their ability to modulate expression or transport of proteins related to the leptin receptor.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific acid probes is useful in in situ hybridisation, in Southern, Northern or dotones to hybridisation of any gene, in mapping the 5' termini of mRNA melecules by containing of additional subclones containing segments of DNA that have been containing segments of DNA that have been contained in electronic format directly from ucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from the necessarial contains and the microarray. Note: The sequence of the contains of any sequence of the contains of any sequence of the contains of any sequence of the sequence of the contains patent can also be obtained in electronic format directly and recontains of any sequence. The sequence of the contains and the microarray. Note: The sequence of the contains and the microarray of the contains patent can also be 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the

                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primers AAV17684-87 are used in a reverse transciptase PCR (RT-PCR) reaction to amplify DNA encoding human leptin receptor gene-related protein (LRGRP). The CDNA sequence was first isolated in Incyte clone 492703 from the NHV2 cell line CDNA library through a computer generated search for amino acid sequence alignments. The LRGRP protein has some homology to the membrane associated proteins of Caenorhabditis elegans of RT C308. The agonists of LRGRP can be used to treat metabolic, reproductive and developmental disorders, whilst antagonists of LRGRP can be used for treatment of cancer or connective tissue disorders e.g. rheumatoid arthritis and Sjogren's syndrome. Polymucleolides which hybridise to the LRGRP nucleotide sequence can be used for detection
                                                                                                                                      Human; leptin receptor gene-related protein; LRGRP; Incyte clone 492703; treatment; cancer; connective tissue disorder; PCR primer; ss.

PCR primers AAV17684-87 are used in a reverse transciptase PCR (RT-PCR) reaction to amplify DNA encoding human leptin receptor gene-related protein (LRGRP). The CDNA sequence was first isolated in Incyte clone 492703 from the NHTZ cell line CDNA library through a computer generated search for amino acid sequence alignments. The LRGRP protein has some homology to the membrane associated proteins of Canorhabditis alone one one used to treat metabolic, reproductive and developmental disorders, whilst antagonists of LRGRP can be used for treatment of cancer or connective tissue disorders e.g. rheumatoid archritis and Sjogren's syndrome. Polynucleotides which hybridise to the LRGRP nucleotide sequence can be used for detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; full length cDNA; cDNA synthesis; oligo-capping; PCR primer; ss.

                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                 clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5' - and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a primer used to amplify a human cDNA clone provided in the invention
                                                                                                                          830 Primers useful for synthesizing full length cDNA clones and their use in genetic manipulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Clone specific PCR primer to amplify human full length cDNA SeqID 4299.

                     it refers
This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refer to secretory or membrane proteins that are potential therapeutic agents/target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction,

The present invention relates to a leptin receptor related protein (OB-RGRP) antisense oligonucleotide (ON; ADRZ7653), that hybridises rGRP) antisense oligonucleotide (ON; ADRZ7653), that hybridises preditically with and inhibits the expression of ADRZ7652. The ON promotes expression of leptin receptors on the cell surface and may critathylaneglycol residue at the 3'-end. Also claimed are interfering RNA triathylaneglycol residue at the 3'-end. Also claimed are interfering RNA (IRNA) of 15-25 nt that hybridize specifically with ADRZ7672, and inhibit companies of 15-25 nt that hybridize specifically with ADRZ7672, and inhibit companies of 15-25 nt that hybridize specifically with ADRZ7672, and inhibit confined are fusion proteins (FPS) and their expression of OB-RGRP. Also claimed are fusion proteins (FPS) and their coding sequences comprising OB-RGRP or NY047 (thought to be a member of coding sequences comprising OB-RGRP or NY047) (thought to be a member of the OB-RGRP family, shares 68% homology with OB-RGRP), and a protein that it is a donor or acceptor of energy e.g. luciferase or yellow fluorescent or the leptin receptor and OB-RGRP proteins, which can be used to prevent or the leptin receptor and OB-RGRP proteins, which can be used to prevent or creat leptin-related disorders. On also related disorders, e.g. osteoporosis (or other conditions involving reduced bone density);

calcification, obseity, diabetes, anorexia; disorders of sexual maturity, and inflammation, fetal development and cancer. The present OB-RGRP antisense oligonucleotide was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Osteopathic; Anorectic; Antidiabetic; Cytostatic; Antiinflammatory; Immunomodulatory; Anabolic; Endocrine; Antianemic; Antiangiogenic; Leptin receptor related protein; OB-RGRP; leptin receptor related protein; OS-RGRP; leptin receptor; Desity; antiportarion; obesity; diabetes; anorexia; sexual maturity disorder; haematopoiesis; angiogenesis; thrombus formation; immunity; inflammation; fetal development; cancer;
                                                                      New oligonuclectides that inhibit expression of the leptin receptor related protein, useful for treatment and prevention of e.g. osteoporosis, obesity, diabetes, anorexia, hematopoiesis, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The present invention relates to a leptin receptor related protein (OB-RGRP) antisense oligomucleotide (ON; ADR27653), that hybridises CC RGRP) antisense oligomucleotide (ON; ADR27653), that hybridises pecifically with and inhibits the expression of ADR27652. The ON contain phosphorothioate bonds; 2'-on-dethyl nucleotides and/or a criterhyleneglycol residue at the 3'-end. Also claimed are interfering RNA triethyleneglycol residue at the 3'-end. Also claimed are interfering RNA (IRNA) of 15-25 nt that hybridize specifically with ADR2767, and inhibit companies sequences comprising OB-RGRP or MY047 (thought to be a member of coding sequences comprising OB-RGRP or MY047 (thought to be a member of the OB-RGRP family, shares 68% homology with OB-RGRP), and a protein that the OB-RGRP family, shares 68% homology with OB-RGRP), and a protein that the OB-RGRP family, shares 68% homology with OB-RGRP), and a protein that the OB-RGRP family, shares 68% homology with OB-RGRP), and observed to receptor and OB-RGRP proteins, which can be used to prevent or the leptin receptor and OB-RGRP proteins, which can be used to prevent or treat leptin-related disorders OF, also osteoporosis (or other conditions involving reduced bone density), calcification; obesity, diabetes; anorexia; disorders of sexual maturity, had and inflammation, feed domestic of a protein of a protei
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Osteopathic; Anorectic; Antidiabetic; Cytostatic; Antiinflammatory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New oligonucleotides that inhibit expression of the leptin receptor related protein, useful for treatment and prevention of e.g. osteoporosis, obesity, diabetes, anorexia, hematopolesis, and

oligonucleotides that inhibit expression of the leptin receptor related protein, useful for treatment and prevention of e.g. osteoporosis, obesity, diabetes, anorexia, hematopoiesis, and angiogenesis. New

Example 6; Fig 1; 104pp; French.

The present invention relates to a leptin receptor related protein (OB-RGRP) antisense oligonuclectide (ON; ADR27653) that hybridises apecifically with and inhibits the expression of ADR27652. The ON promotes expression of leptin receptors on the cell surface and may contain phosphorothioate bonds; 2'-O-methyl nucleotides and/or a rise state at the 3'-end. Also claimed are interfering RNA (IRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit expression of OB-RGRP. Also claimed are fusion proteins (FPS) and their coding sequences comprising OB-RGRP or MY047 (thought to be a member of the OB-RGRP family, shares 68% homology with OB-RGRP), and a protein that is a donor or acceptor of energy e.g. luciferase or yellow fluorescent protein (YFP) for detecting compounds that modify the interaction between the leptin receptor and OB-RGRP proteins, which can be used to prevent or treat leptin-related disorders. Proteins in the leptin receptor and OB-RGRP proteins, which can be used to prevent or treat leptin-related disorders of sexual maturity, calcification; obseity; diabetes; anorexia; disorders of sexual maturity, and the latest of the maturity of the latest o The present OB-RGRP antisense oligonucleotide was used to illustrate the invention fetal development and cancer. inflammation,

triethyleneglycol residue at the 3'-end. Also claimed are interfering RNA (IRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit expression of OB-RGRP. Also claimed are fusion proteins (FPS) and their coding sequences comprising OB-RGRP or MYO47 (thought to be a member of the OB-RGRP family, shares 68* homology with OB-RGRP), and a protein that the OB-RGRP family, shares 68* homology with OB-RGRP), and a protein that is a donor or acceptor of energy e.g. ludiferase or yellow fluorescent protein (YFP) for detecting compounds that modify the interaction between the leptin receptor and OB-RGRP proteins, which can be used to prevent or treat leptin-related disorders or used for prevention and/or treatment of leptin-related disorders, e.g. osteoporosis (or other conditions involving reduced bone density); calcification; obesity; diabetes, anoreaxis; disorders of sexual maturity, and inflammation, fetal development and cancer. The present OB-RGRP and inflammation, fetal development and cancer. The present OB-RGRP antisense oligonucleotide was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Osteopathic; Anorectic; Antidiabetic; Cytostatic; Antiinflammatory; Immunomodulatory; Anabolic; Endocrine; Antianemic; Antiangiogenic; Leptin receptor related protein; OB-RGRP; leptin receptor solutions; osteoporosis; calcification; obesity; diabetes; anorexia; sexual maturity disorder; haematopolesis; angiogenesis; thrombus formation; immunity; inflammation; fetal development; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BXXXEX
                                                                                                                                                                                                                                                                                The present invention relates to a leptin receptor related protein (OB-RGRP) antisense oligonucleotide (ON; ADR27653), that hybridises respecifically with and inhibits the expression of ADR27652. The ON promotes expression of leptin receptors on the cell surface and may contain phosphorothioate bonds; 2'-O-methyl nucleotides and/or a ritethylaneslycol residue at the 3'-end. Also claimed are interfering RNA (IRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit expression of OB-RGRP. Also claimed are fusion proteins (FPB) and their coping sequences comprising OB-RGRP or MV047 (thought to be a member of the OB-RGRP family, shares 68 th homology with OB-RGRP), and a protein that is a donor or acceptor of energy eq. luciferase or yellow fluorescent protein (YFP) for detecting compounds that modify the interaction between treat leptin receptor and OB-RGRP proteins, which can be used to prevent or treat leptin related disorders. Ow, also related interfering RNA, are used for prevention and/or treatment of leptin-related disorders, e.g. cateoporosis (or other conditions involving reduced bone density, calculation; obesity; diabetes; anorexia; disorders of sexual maturity, hand interfering candinal development and cancer. The present OB-RGRP and inflammation fermation, regalation of immunity and interfering conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention relates to a leptin receptor related protein (OB-
KGRP) antisense oligonucleotide (ON; ADR27653), that hybridises

CC RGRP) antisense oligonucleotide (ON; ADR27653), that hybridises

CC specifically with and inhibits the expression of ADR27652. The ON

CC promotes expression of leptin receptors on the cell surface and may

CC contain phosphorothioate bonds; 2'-on-ethyl nucleotides and/or a

CC (IRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit

CC (IRNA) of 15-25 nt that hybridize specifically with ADR27673, and inhibit

CC coding sequences comprising OB-RGRP or WY047 (thought to be a member of

CC coding sequences comprising OB-RGRP or WY047 (thought to be a member of

CC coding sequences comprising OB-RGRP or WY047 (thought to be a member of

CC coding sequences comprising OB-RGRP or WY047 (thought to be a member of

CC the OB-RGRP family, shares 68% homology with OB-RGRP), and a protein that

CS a donor or acceptor of energy e.g. luciferase or yellow fluorescent

CS the OB-RGRP family, shares 68% homology with OB-RGRP), and a protein that

CC treat leptin-related disorders. ON, also related interfering RNA, are

CC treat leptin-related disorders of sexual maturity,

CC calcification; obseity; diabetes, anorexis, disorders of sexual maturity,

CC aclicitation, eteral development and cancer. The present OB-RGRP

CC antisense oligonucleotide was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New oligonucleotides that inhibit expression of the leptin receptor related protein, useful for treatment and prevention of e.g. osteoporosis, obesity, diabetes, anorexia, hematopoiesis, and

related protein, useful for treatment and prevention of e.g.
angiogenesis.

Example 6; Fig 1; 104pp; French.

Example 6; Fig 1; 104pp; French.

The present invention relates to a leptin receptor related protein (OBGRARP) antisense oligonuclectide (ON: ADR27653), that hybridises
ppecifically with and inhibits the expression of ADR27652. The ON
promotes expression of leptin receptors on the cell surface and may
contain phosphorothicate bonds; 2.0-enchyl nucleotides and/or a
triethyleneglycol residue at the 3'-end. Also claimed are innerfering RNA
triethyleneglycol residue at the 3'-end. Also claimed are innerfering (IRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit
cypression of OB-RGRP. Also claimed are fusion proteins (FPS) and their
coding sequences comprising OB-RGRP or MYO47 (thought to be a member of
the OB-RGRP family, shares 68\* homology with OB-RGRP), and a protein the leptin receptor of energy e.g. ludiferase or yellow fluorescent
protein (YPP) for detecting compounds that modify the interfering RNA, are
treat leptin-related disorders. ON, also related interfering RNA, are
treat leptin-related disorders. ON, also related disorders, e.g.
osteoporosis (or other conditions involving reduced bone density);
calcification; obesity; diabetes; anorexia; disorders of sexual maturity,
haematopoiesis, angiogenesis, thrombus formation, regulation of immunity
and inflammation, fetal development and cancer. The present OB-RGRP
antisense oligonucleotide was used to illustrate the invention.

specifically with and inhibits the expression of ADR27652. The ON promotes expression of leptin receptors on the cell surface and may contain phosphorochioate bonds; 2'-O-methyl nucleotides and/or a triethyleneglycol residue at the 3'-end. Also claimed are interfering RNA (iRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit expression of OB-RGRP. Also claimed are fusion proteins (FPS) and their coding sequences comprising OB-RGRP or MYO47 (thought to be a member of the OB-RGRP family, shares 68* homology with OB-RGRP), and a protein that is a donor or acceptor of energy e.g. luciferase or yellow fluorescent protein (FPS) for detecting compounds that modify the interaction between the leptin receptor and OB-RGRP proteins, which can be used to prevent or treat leptin-related disorders. ON, also related interfering RNA, are used for prevention and/ob-rarement of leptin-related disorders, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Osteopathic; Anorectic; Antidiabetic; Cytostatic; Antiinflammatory; Immunomodulatory; Anabolic; Endocrine; Antianemic; Antiangiogenic; Immunomodulatory; Anabolic; Endocrine; Antianemic; Antiangiogenic; Leptin receptor; Immunomotory; Immunic; OB-RGRP; Isptin receptor; Impuration; Obesity; diabetes; leptin-related disorders; osteoporosis; calcification; obesity; diabetes; anorexia; sexual maturity disorder; haematopoiesis; angiogenesis; thrombus formation; immunity; inflammation; fetal development; cancer;

The present invention relates to a leptin receptor related protein (OB-RGRP) antisense oligonucleotide (ON; ADR27653), that hybridises gpecifically with and inhibits the expression of ADR27652. The ON promotes expression of leptin receptors on the cell surface and may contain phosphorothioate bonds; 2'-one thy luncleotides and/or a contain phosphorothioate bonds; 2'-one the OB-RGRP, and an interfering RNA (IRNA) of 15-25 in that hybridize specifically with ADR27672, and inhibit expression of OB-RGRP. Also claimed are fusion proteins (FPB) and thair colling sequences comprising OB-RGRP or MY047 (thought to be a member of the OB-RGRP family, shares 68% homology with OB-RGRP), and a protein that contain the contain of OB-RGRP proteins, which can be used to prevent or treat leptin-related disorders on allowed the conditions involving reduced bone density, are calcification; obesity, diabetes; anorexia; disorders of sexual maturity, chammatopolesis, anglogenesis, thrombus formation, regulation of immunity and inflammation, fetal development and cancer. The present OB-RGRP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Osteopathic, Anorectic, Antidiabetic; Cytostatic; Antinflammatory; Immunomodulatory; Anabolic; Endocrine; Antianemic; Antianglogenic; Leptin receptor related protein; OB-RGRP; leptin receptor; leptin-related disorders; osteoporossis; calcification; obesity; diabetes; anorexia; sexual maturity disorder; haematopoiesis; angiogenesis; thrombus formation; immunity; inflammation; fetal development; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

OB-RGRP antisense oligonucleotide, AS 08.
             04-NOV-2004 (first entry)
The present invention relates to a leptin receptor related protein (OB-RRP) antiennse oligonuclectide (ON; ADR27653), that hybridises graps antiennse oligonuclectide (ON; ADR27653), that hybridises promotes expression of leptin receptors on the cell surface and may contain phosphorothicate bonds; 2.0-methyl nuclectides and/or a contain phosphorothicate bonds; 2.0-methyl nuclectides and/or a contain phosphorothicate bonds; 2.0-methyl nuclectides and/or a contain phosphorothicate specifically with ADR27672, and inhibit expression of OB-RGRP. Also claimed are fusion proteins (FPB) and inhibit expression of OB-RGRP and OB-RGRP of Claimed are fusion proteins (FPB) and a protein that is a donor or acceptor of energy e.g. luciferase or yellow fluorescent protein (FPP) for detecting compounds that modify the interaction between the leptin receptor and OB-RGRP proteins, which can be used to prevent or treat leptin-related disorders. ON, also related disorders, e.g. creat leptin-related disorders. ON, also related blooders, e.g. calcification; obesity; diabetes; anorexia; disorders of sexual maturity, hemantopolesis, angiogenesis, thrombus formation, regulation of immunity continued the context of the present one familiammation, feel development and cancer. The present OB-RGRP protein that the mation of immunity and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```
The present invention relates to a leptin receptor related protein (OBCRGRP) antisense oligonucleotide (ON; ADR27653), that hybridises

CC specifically with and inhibits the expression of ADR27652. The ON

CD promotes expression of leptin receptors on the cell surface and may

CC promotes expression of leptin receptors on the cell surface and may

CC contain phosphorothioate bonds; 2'-one thyl nucleotides and/or a

CC (IRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit

CC (IRNA) of 16-25 nt that hybridize specifically with ADR27672, and inhibit

CC coding sequences comprising OB-RGRP or WY047 (thought to be a member of

CC chops sequences comprising OB-RGRP or Juciferase or yellow fluorescent

CC coding sequences comprising OB-RGRP or Juciferase or yellow fluorescent

CC the OB-RGRP for detecting compounds that modify the interaction between

CC treat leptin receptor and OB-RGRP proteins, which can be used to prevent or

CC treat leptin receptor and OB-RGRP proteins, which can be used to prevent or

CC treat leptin related disorders ON, also related interfering RNA, are

CC used for prevention and/or treatment of leptin-related disorders, or

CC used for prevention and/or treatment of leptin-related disorders,

CC used for prevention and/or treatment of leptin-related disorders,

CC calcification; obesity, diabetes; anorexia, disorders of sexual maturity,

CC harmal popularity in angiogenesis, thrombus formation, regulation of immunity

The present invention relates to a leptin receptor related protein (OBROBE) antisense oligomucleotide (ON; ADR27653), that hybridises appecifically with and inhibits the expression of ADR27652. The ON promotes expression of Leptin receptors on the cell surface and may contain phosphorothicate bonds; 2'O-methyl nucleotides and/or a contain phosphorothicate bonds; 2'O-methyl nucleotides and/or a propersion of OB-RGRP. Also claimed are interfering RNA (IRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit expression of OB-RGRP. Also claimed are fusion proteins (FPP) and their coding sequences comprising OB-RGRP or WY047 (thought to be a member of the OB-RGRP family, shares 68 homology with OB-RGRP), and a protein that is a donor or acceptor of energy e.g. luciferase or yellow fluorescent protein (FPP) for detecting compounds that modify the interaction between the leptin receptor and OB-RGRP proteins, which can be used to prevent treat leptin related disorders. ON, also related interfering RNA, are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               leptin-related disorders; osteoporosis; calcification; obesity; diabetes; anorexia; sexual maturity disorder; haematopoiesis; angiogenesis; thrombus formation; immunity; inflammation; fetal development; cancer;
                                                                                                                                                                                                                                                                                                                                    used for prevention and/or treatment of leptin-related disorders, e.g. osteoporosis (or other conditions involving reduced bone density); calcification; obesity, disbetes; anorexia; disorders of sexual maturity, haematopolesis, angiogenesis, thrombus formation, regulation of immunity and inflammation, fetal development and cancer. The present OB-RGRP antisense oligonucleotide was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Osteopathic; Anorectic; Antidiabetic; Cytostatic; Antiinflammatory; Immunomodulatory; Anabolic; Endocrine; Antianemic; Antiangiogenic; Leptin receptor related protein; OB-RGRP; leptin receptor;

The present invention relates to a leptin receptor related protein (OB-RGRP) antisense oligonucleotide (ON; ADR27653), that hybridises content antisense oligonucleotide (ON; ADR27653), that hybridises content and inhibits the expression of ADR27652. The ON promotes expression of leptin receptors on the cell surface and may contain phosphorothioate bonds; 2'-o-methyl nucleotides and/or a crietchyleneglycol residue at the 3'-end. Also claimed are interfering RNA triethyleneglycol residue at the 3'-end. Also claimed are interfering RNA (iRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit content of the OB-RGRP place of the OB-RGRP place of the OB-RGRP place of the OB-RGRP family, shares 68% homology with OB-RGRP), and a protein that is a donor or acceptor of energy e.g. luciferase or yellow fluorescent correct leptin receptor of energy e.g. luciferase or yellow fluorescent creat leptin-related disorders. ON, also related interfering RNA, are created for prevent or the leptin receptor and OB-RGRP proteins, which can be used to prevent or creat leptin-related disorders. ON, also related interfering RNA, are created for other conditions involving reduced bone density).

Cued for prevention and/or treatment of leptin-related disorders, e.g. osteoporosis (or other conditions involving reduced bone density), chaematopoiesis, angiogenesis, thrombus formation, regulation of immunity and inflammation, fetal development and cancer. The present OB-RGRP cand inflammation, fetal development and cancer. The present on.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antidiabetic, anorectic, weight loss; weight gain; diabetes; LEPROTLI; leptin receptor overlapping transcript-like 1; OB-RGRP; leptin receptor gene related protein; intracellular transport; obesity;

The invention relates to a method for identifying compounds (I) that are active against loss or gain of weight or diabetes in humans or animals. The method comprises measuring the effect of a test compound on the expression of at least one of the agaes LEBROTL1 (leptin receptor verlapping transcript-like 1) or OB-RGRP (leptin receptor gene related protein). Alternatively the method comprises measuring the effect of the protein). Alternatively the method comprises measuring the effect of the presence at CM, and internalisation from the membrane of proteins (X) encoded by the specified genes, or parts of them. Compounds of the invention are used to treat or prevent obesity, weight loss and diabetes. The current sequence represents a primer for the amplification of OB-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                          Identifying compounds useful for treating loss or gain of weight or diabetes, from their ability to modulate expression or transport of proteins related to the leptin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to mapping a pathway of differentiation of a population of embryonic cells, comprising (a) selecting: (i) a set of gene expression products, where each gene expression products, in the set of a characteristic of a cell type that has undergone differentiation, so that several differentiated cell types are represented in the set and (i) an exogenous factor in the set and caracterising the exogenous factor to the population of embryonic cells, (c) characterising the effect of the exogenous factor on the differentiation products in the set and (d) mapping the pathway of differentiation of products in the set and (d) mapping the pathway of differentiation of cells. The method is useful for annipulating cells. The method is useful for annipulating differentiation of embryonic stem cells. The method is particularly useful for manipulating differentiation of human embryonic stem cells to provide a uniform population of precursors and differentiated cells of a desired lineage. The differentiated cells may be used for treating a medical condition in pathologies, (e.g. heart muscle damage, kidney tissue degeneration, skin and it muscles in the set and condition in the set and condition in the pathologies, (e.g. heart muscle damage, liver degeneration, skinners, it muscles in the pathologies of the pathologies o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
Mapping a pathway of or directing differentiation of human embryonic cells, comprises exposing cells to an exogenous factor and measuring gene expression products characteristic of the particular cell type or

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more
                                                                                                                                            based on the 5' untranalated region (5'UTR) of the human ob receptor (OB R) sequence. Primers HOBR IF (AAT64981) and HOBR IF-2 were paired with rat OB-R specific reverse primers ROBR 11 (AAT64983) or ROBR 12 (AAT64984) to amplify the 5' end of rat OB-R CDNA. The largest product, obtained with HOBR IF-2 and ROBR11, was a 500 bp fragment that covered the 5' region and included a Met codon. Pull-length sequences for lean rat OB-R CDNA (AAT64961) and fatty (fa) mutant rat OB-R CDNA (AAT64061) and fatty (fa) mutant rat OB-R CDNA (AAT64062).
                               Rat wild-type and mutant ob receptor protein - useful in identification of new ligands for prevention and treatment of obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                This oligonuclectide comprises forward PCR primer HOBR 1F-2, which is
                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 63072; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring 

gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotbrook hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html ö Rat wild-type and mutant ob receptor protein - useful in identification of new ligands for prevention and treatment of obesity. This oligonucleotide comprises forward PCR primer HOBR IF, which is based on the 5' untranslated region (5'UTR) of the human ob receptor (OB-R) sequence. Primers HOBR IF and HOBR IF-2 (AAT64982) were paired with rat ober specific reverse primers ROBR II (AAT64983) or ROBR 12 (AAT64984) to amplify the 5' end of rat OB-R CDNA. Full-length sequences for lean rat OB-R cDNA (AAT64961) and fatty (fa) mutant rat OB-R CDNA (AAT64062), which differ by only 1 bp, were subsequently obtained 1.6%; Score 18; DB 1; Length 18; 100.0%; Pred. The receptor can be used to identify and purify ligands and activators. An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor antibody can be used as an agonist differentiation of a cell expressing the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or erythroid blood cell lineages. This is useful when a mammal, especially a human, is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to reappulate blood cells in a mammal. The products can also be used to treat, e.g. neoplastic disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases,

The present sequence is the antisense oligonucleotide +85 for the human WSX receptor cDNA. The receptor can be used to identify and purify and agonist to activators. An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor, leading to enhanced proliferation of a cell expressing the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or erythroid blood cell inneages. This is useful when a mammal, especially a human, is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to repopulate blood cells in a mammal. The products can also be used to repopulate blood cells in a mammal. The products can also be used to repopulate blood cells in a mammal. The products can also be used to react, e.g. neoplastic disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases,

The invention relates to an isolated cytokine receptor which plays a role in enhancing proliferation and/or differentiation of haematopoietic clus, termed WSX receptor comprising the amino acid sequence of mature cells, termed WSX receptor comprising the amino acid sequence of mature ceptor is useful for identifying a molecule which binds to and/or receptor is useful for identifying a molecule which binds to and/or creeptor is useful for identifying a molecule which binds to and/or creeptor is useful for identifying a molecule which binds to and/or creeptor is useful for undargostic cells (such as anaemia, thrombocytopaenia, decrease in hematopoietic cells (such as anaemia, thrombocytopaenia, hypoplasia, disseminated intravascular coagulation, myelodysplasia, climmune clutoimmune) thrombocytopaenic purpura (ITP) and HIV induced ITP), comporting repopulation of mature blood cell lineages in cells having condergone chemo- or radiation of mature blood cell lineages in cells having to the way receptor is useful for producing anti-WSX receptor antibodies, cor affinity purification of WSX ligand, for competitive screening of for affinity purification of WSX ligand, for competitive screening of consecutal weight markers, as reagents for mechanism studies of the WSX receptor or its ligands, to study the role of the WSX receptor and WSX ligand in normal growth and development, as well as abnormal growth and development, as standards or controls in assays
                                                                                                                                                                                                                                                                                                       Human; ss; WSX receptor; antianaemic; haemostatic; anticoagulant; neuroprotective; immunosuppressive; dermatological; anti-HIV; probe; antiinflammatory; anorectic; antidiabetic; cytostatic; antitumour; cytokine receptor; proliferation; differentiation; haematopoietic cell; anaminist thrombocytopaenia; hypoplasia; myelodysplasia; HIV induced ITP; disseminated intravascular coagulation; immune thrombocytopaenic purpura; ITP; myeloproliferative thrombocytotic disease; thrombocytosis; inflammatory condition; iron deficiency; obesity; diabetes; mature blood cell lineage; chemotherapy; radiation therapy; bone marrow transplantation; metabolic disorder; anorexia; eteroid-induced truncalobesity; stem cell tumour; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated cytokine receptor, termed WSX receptor, useful for
treating diseases characterized by a decrease in hematopoietic cells e.g.
anemia, or for treating myeloproliferative thrombocytotic diseases.
                                                                                                                                                                                                                                                                        Human WSX receptor -47nt antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 8; Fig 7; 77pp; English.

```
The invention relates to an isolated cytokine receptor which plays a role in enhancing proliferation and/or differentiation of haematopoietic cells, termed Wax receptor comprising the amino acid sequence of mature human Wax receptor variant 13.2 or its extracellular domain. The Wax receptor is useful for identifying a molecule which binds to and/or activates the Wax receptor, as a disanositic tool for measuring serum elevels of endogenous Wax ligand, for treating diseases characterised by a decrease in hematopoietic cells (such as anaemia, thrombocytopaenia, hypoplasia, disseminated intravascular coagulation, myelodysplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ss; WSX receptor; antianaemic; haemostatic; anticoagulant; neuroprotective; immunosupressive; dermatological; anti-HIV; probe; antiinflammatory; anorectic; antidiabetic; cytostatic; antitumour; cytokine receptor; proliferation; differentiation; haematopoietic cell; disseminated intravascular coagulation; immune thrombocytopaenic purpura; ITP; myeloproliferative thrombocytotic disease; thrombocytopaenic purpura; inflammatory condition; iron deficiency; obesity; diabetes; mature blood cell lineage; chemotherapy; radiation therapy; bone marrow transplantation; metabolic disorder; anorexia; steroid-induced truncalobesity; stem cell tumour; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated cytokine receptor, termed WSX receptor, useful for treating diseases characterized by a decrease in hematopoietic cells e.g. anemia, or for treating myeloproliferative thrombocytotic diseases.
                                                                                                                                                                                                              ö
for WSX receptor. A composition comprising the WSX polypeptide is useful as an antagonist for reducing activation of endogenous WSX receptor, and to treat metabolic disorders (e.g. anorexia or steroid-induced truncalobesity), stem cell tumours and other tumours which express WSX receptor. The present sequence represents a human WSX receptor probe used
                                                                                                                                                                                                              Gaps

Annual (auconfinance) in Doubocytotic diseases, thrombocytosis from inflammatory conditions and in iron deficiency, obesity or diabetes, inflammatory conditions and in iron deficiency, obesity or diabetes, cenhancing repopulation of mature blood cell lineages in cells having undergone chemo- or radiation therapy or bone marrow transplantation therapy, or for promoting kidney, liver and lung growth and/or repair. The WSX receptor is useful for producing anti-WSX receptor antibodies, for affinity purification of WSX ligand, for competitive screening of potential agonists or antagonists for binding to the WSX receptor, as molecular weight markers, as reagents for molecular weight markers, as reagents for molecular weight markers, as reagents for molecular weight markers, or study, the role of the WSX receptor and WSX ingand in normal growth and development, as well as abnormal growth and development, e.g., in malignancies, or as standards or controls in assays for WSX receptor. A composition comprising the WSX polypeptide is useful as an antagonist for reducing activation of endogenous WSX receptor, and truncalobesity), stem cell tumours and other tumours which express WSX traceptor. The present sequence represents a human WSX receptor probe used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Leptin receptor; WSX receptor; metabolic disorder; ITP; ss; antisense; anoraxia; eteroid-induced truncalobesity; stem cell tumnour; tumnour; DIC; anaemia; thrombocytopaenia; hypoplasia; myelodysplasia; HIV-induced ITP; disseminated intravascular coaqulation; immune thrombocytopaenic purpura; myelopycliferative thrombocytotic disease; thrombocytopis; inflammatory condition; iron deficiency; disabetes; renal failure; haemacopoietic cell proliferation; bone marrow transplantation.

ö
proteins), a partial mouse WSX receptor and its encoding DNA sequence. The WSX receptor is useful for preparing a composition for treating diseases mediated by WSX receptor, especially diseases characterised by a decrease in haematopoletic cells, e.g., anaemia, thrombocytopaenia, hypoplasia, disseminated intravascular coagulation (DIC), myelodysplasia, immune (autoimmune) thrombocytopaenic purpura (ITP), and HIV induced ITP. The WSX receptor is also useful for treating metabolic disorders such as anorexia, obesity (e.g. steroid-induced truncalobeaity) tumours such as stem cell tumours, inflammatory conditions, iron deficiency, diabetes, renal failure, conditions related to haematopoietic cell proliferation (such as in bone marrow transplantation and for promoting kidney, lung and liver growth and/or repair. An experiment was performed to show antisense inhibition of human and mouse WSX receptors. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated leptin/WSX receptor comprising a sequence of mature human WSX receptor variant 12.1. Also disclosed are the 13.2 and 6.4 WSX receptor variants (and DNA molecules encoding all 3 proteins), a partial mouse WSX receptor and its encoding DNA sequence. The WSX receptor is useful for preparing a composition for treating decrease in haematopoietic cells, e.g., anaemia, thrombocytopsenia, hypoplasia, disseminated intravascular coagulation (DIC), myelodysplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Leptin receptor; WSX receptor; metabolic disorder; ITP; ss; anorexia; steroid-induced truncalobesity; stem cell tumour; tumour; DIC; anaemia; thrombocycopaenia; hypoplasia; myelodysplasia; HIV-induced ITP; disseminated intravascular coagulation; immune thrombocytopaenic purpura; myeloproliferative thrombocytoic disease; thrombocytosis; inflammatory condition; iron deficiency; diabetes; renal failure; haematopoletic cell proliferation; bone marrow transplantation.
                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New WSX receptor, useful for preparing a composition for treating diseases mediated by WSX receptor e.g., diabetes or obesity.

The agonist antibodies are useful for activating the WSX receptor and for enhancing proliferation or differentiation of a cell comprising the WSX receptor, by exposing the cell to an antibody. The antibodies are also useful for reducing weight, specifically in the
immune (autoimmune) thrombocytopaenic purpura (ITP), and HIV induced ITP. The WSX receptor is also useful for treating metabolic disorders such as such exanorexia, obesity (e.g. steroid-induced truncalobesity) tumours such as stem cell tumours, inflammatory conditions, iron deficiency, diabetes, renal failure, conditions related to haematopoietic cell proliferation and liver prometing kidney, lung and liver growth and/or repair. An experiment was performed to show antisense inhibition of human and mouse WSX receptors. The present sequence is a sense (control) oligonucleotide used in the experiment
                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel agonist antibody useful for activating WSX receptor and for enhancing proliferation or differentiation of a cell comprising WSX receptor, which specifically binds to the WSX receptor.
                                                                                                                                                                                                                                           ;

treatment of obesity, bulimia and other disorders associated with abnormal expression or functions of WSX receptor genes, for treating metabolic disorders such as diabetes, for reducing excessive levels of insulin in human patients and for treating patients suffering from food consumption and related pathological conditions such as type II adult onset diabetes, infertility, hypercholesterolemia, hyperlipidaemia, cardiovascular diseases, arteriosclercosis, polycystic ovarian disease, osteoarthitis, dermatological disorders, insulin resistance, osteoarthitis, dermatological disorders, insulin resistance, osteoarthitis, dermatological disorders, insulin resistance, osteoarthitis, dermatological fisher and allments, lung dysfunctions such as emphysema, hemorrhages, diseases characterised by decrease in blood cells such as anaemia, thrombocytopenia, hypoplasia, center tumour related disorders und anorexia and loss of appetite, and other tumour related disorders. This sequence represents a human WSX receptor DNA antisense oligonucleotide.

The invention relates to agonist antibodies which specifically bind to the human WSX receptor. The agonist antibodies are useful for activating the wax receptor and for enhancing profileration or differentiation of a cell comprising the WSX receptor, by exposing the cell to an antibody.

The antibodies are also useful for reducing weight, specifically in the treatment of obesity, bulinia and other disorders associated with a bnormal expression or functions of WSX receptor genes, for treating metabolic disorders such as diabetes, for reducing excessive levels of insulin in human patients and for treating patients suffering from food consumption and related pathological conditions such as type II adult onset diabetes, infertility, hypercholesterolaemia, hypertipidaemia, cardiovascular diseases, arteriosclerosis, polycystic ovarian disease, exteriosclerosis, polycystic ovarian disease, orteriosclerosis, insulin resistance, hypertriglyceridaemia, cancer, cholelithiasis and hypertension. The antibodies are also useful for treating kidney allments, lung decrease in blood calls such as anaemia, thrombocytopenia, hypoplasia, metabolic disorders such as cachexia, anorexia and loss of appetite, and other tumour related disorders. This sequence represents a human WSX receptor DNA antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for analysing microsatellite loci. In method involves coamplifying a set of 3 microsatellite loci, comprising a specific mononucleotide repeat locus selected from the group consisting of BAT-25, BAT-26, BAT-40, MONO-11 and MONO-15 and two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          coamplifying
loci.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analyzing microsatellite loci for detecting microsatellite instability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; microsatellite loci; tumour; familial tumour predisposition;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
tetranucleotide repeat loci selected from FGA, DISSIB, DI7SI299 etc from a sample of genomic DNA and determining the size of the amplified fragments. The method is useful for analysing microsatellite loci and for detecting microsatellite instability (MSI) in genomic DNA. The instability in the set of microsatellite loci are used in prognostic tumour diagnosis for the diagnosis of familial tumour predisposition. It is also used to detect cancerous tumours in the gastrointestinal system and of the endometrium. The cancerous tumours are preferably from a colorectal cancer. The present DNA sequence is a PCR primer which is used for amplifying human BAT-25 locus. This primer is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for determining the presence of neoplastic molecular markers in a host, involving the use of neoplastic molecular marker specific reagents to detect such markers and analysing the array of reagents, allowing the identification of the neoplastic disease present. This can be used to determine the best treatment for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Determining the presence of neoplastic molecular markers, by identifying the presence of markers in host test sample using array of neoplastic molecular marker specific reagents and analyzing the array of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method of analysing microsatellite coloi. The method involves co-amplifying a set of three microsatellite loci loci. The method involves co-amplifying a set of three microsatellite loci comprising at least one mononcleotide repeat locus and at least two terra-nucleotide repeat loci from a sample of genomic DNA in a multiplex amplified DNA fragments obtained. The method is useful for analysing compositellite loci and for detecting microsatellite instability (MSI) in genomic DNA microsatellite loci of the second genomic DNA, where the MSI cresults are useful in prognostic tumour diagnosis, in diagnosis of familial tumour predisposition, to detect cancerous tumours of the cancerous tumours are tumours from a colorectal cancer. The method is useful for detecting or diagnosing diseases associated with MSI such as certain ctypes of cancer and predisposition for cancer and in diagnostic assays to types of cancer and predisposition for cancer and in diagnostic assays computed to determine treatment and prognosis of disease. The present DNA sequence is a primer which is used for amplifying human BAT-25 locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Analyzing micro-satellite loci for detecting or diagnosing cancer, by coamplifying set of three microsatellite loci from DNA sample in multiplex reaction using primers, and determining size of amplified fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a method of analysing microsatellite loci. The invention is used to detect microsatellite instability in prognostic tumour diagnosis, particularly a familial tumour prediagnosition especially to detect cancerous tumours of the gastrointestinal system or endometrium, most particularly colorectal cancer. The present sequence represents a human microsatellite locus PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analyzing microsatellite instability by amplification of multiple loci including mono-nucleotide and tetra-nucleotide repeats useful to detect cancerous gastrointestinal or endometrium tumors particularly colorectal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Calso disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of at least one or more nucleic acid states and detecting the hybridisation. The nucleic acid probes are and detecting the hybridisation. The nucleic acid probes are altached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific or nucleic acids further comprises a tag sequence or specific acid subclones to matations of any gene, in mapping the 5' terminal of mRNA molecules by containing segments of DNA that have been containing segments of DNA that have been containing segments of DNA that have been contained in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence thml
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tumour suppression; tumour reversion; apoptosis; virus resistance; yrtostatic; virucide; neuroprotective; nootropic; neuroleptic; probe; primer; PCR; gene chip; antisense; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ds; human.
                                                                                                                                                                                                                                 New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human tumour suppression/reversion-related DNA sequence SeqID3789

in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, viruside, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention.

Specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                    New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                         This invention relates to novel isolated nucleic acid sequences involved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antilipaemic, Cardiovascular, Analgesic; Antianginal, Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "This oligonucleotide has a phosphorothioate backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all

Also all cytidine residues are 5-methylcytidines"
                                                                                                                                                       New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.
                                                                                                                                                                                                                                                  The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of EL. The antisense oligonucleotides or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human endothelial lipase antisense oligonucleotide, SEQ ID 3648.

New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Induction of seed development in plants in the absence of fertilization by inhibiting or preventing the expression of a negative regulator of seed formation for production of seedless or soft-seeded fruit.
                                                                                                                                             The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of EL. The actisense oligonucleotides or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular discorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Seed; development; FIS; endosperm; autonomous embryogenesis;

Primers used for determining hepatitis C virus genotype - provide a rapid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence represents a PCR primer used in the invention to prepare the attB-ura4-attB linear DNA, as a PCR product using pLT50 as a template. The invention relates to a novel method for obtaining site-specific gene replacement in a eukaryotic cell comprising employing irreversible recombination sites (IRS) and irreversible recombination sites (IRS) and irreversible recombinates. The method is useful for obtaining specific and stable integration of nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              into chromosomes of eukaryotes or for obtaining site-specific replacement of nucleic acids in a target construct. The method may also be used to stably integrate a polynucleotide into any eukaryotic cell that can be
                                                                                                                             AAT89689-T89744 are individually claimed oligonucleotides used as PCR (polymerase chain reaction) primers for the discrimination of the genotype of hepatitis C virus (HCV). Classification of the genotype of HCV can be achieved precisely and simply according to the International Standardisation of Classification. The primers can be used to distinguible where HCV genotypes 1a, 1b, 2a, 2b, 3a, 3b, 4, 5a, 6a and 6b
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       useful for obtaining specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and stable integration of nucleic acids into chromosomes of eukaryotes, by employing irreversible recombination sites (IRS) and irreversible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR; primer; site-specific gene replacement; irreversible recombinase; irreversible recombination site; IRS; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method of inducing the development of seeds in a plant, comprising inhibiting, interrupting or reducing the seeds in a plant, comprising inhibiting, interrupting or reducing the expression of a negative regulator of seed formation in one or more female reproductive cells, tissues, or organs of the plant or a progenitor cell, tissue or organ. The negative regulator is a polypeptide. The FIS family of genes are known to be capable of cregulating autonomous endosperm development and/or autonomous embryogenesis. In the invention the reduced expression of the negative cregulating autonomous endosperm development and/or autonomous embryogenesis. In the invention the reduced expression of the negative cregulator is achieved by the introduced expression of the present a FIS genetic sequence which may inhibit FIS activity. The present cregarded fruit, where the fruit are made parthenocarpic fruit or sequence represents a PCR primer used to identify the FIS2 gene. Plants of sequence for soft seeded fruit, where the fruit are made parthenocarpic fruit or soft seeded fruit at tissue or organ of the fruit. The plant produced soid in the production of an antisense molecule, a gene-silencing molecule and a dominant-negative sense molecule, a gene-silencing molecule and a dominant-negative sense molecule, a gene-silencing concluded for the production of a transformed plant. The transformed plant is appendent to production of a transformed plant. The transformed plant is appeadnes, citrus fruits such as oranges, lemons, grapefruit and chert fruits such as grapes, apples, melons, pears and madarins and other fruits such as grapes, apples, melons, pears and chert sequely in the planted made of detect the peptides of the invention and characteristics stably between generations. Antibodies produced to the call in an enryme linked immunosorbant assay (ELISA),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to constructing (MI) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by the recombination, of a promoter replacement fragment with a heterologous promoter. (MI) is useful for constructing a strain of diploid fungal promoter. (MI) is useful for constructing a strain of diploid fungal cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus cand for identifying a therapeutic agent for treatment of a mammalian agent, an antifungal agent that inhibits the growth of a diploid fungus compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the compound, signal transduction, proferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a PCR primer used in the method of the invention. Note: The sequence data for this patent is not repersented in the printed appearance is that of a personner of the present sequence is the present of the present sequence is the passed the method of the invention by the printed appearance is the present of the present sequence is the present in the method of the invention by the printed appearance is the present in the present in the present in the present in the present is present.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
